

## APPENDIX 2

**PALYNOLOGY OF TWO CORES FROM  
ARCHEOLOGICAL SITE 7K-C-107,  
KENT COUNTY, DELAWARE**  
**Final Report**  
**Grace S. Brush**

Palynological investigations were carried out for 2 sediment cores collected at Archeological Site 7K-C-107 in Kent County, Delaware by J. Pizzuto and W. Daniels. The palynological investigations were done to provide information on vegetation changes at the site that could be used in developing the Quaternary geomorphologic history of the site. The location of the cores is shown in Fig. 1 (Daniels 1993), and the stratigraphy in Fig. 2 (Daniels, 1993). Table 1 gives the depth, description and  $^{14}\text{C}$  dates of the cores, summarized from Daniels 1993.

Table 1. Description and dates of Core PC-14

Depth (cm)	Date (ybp)	Description
0-24		clayey silt with organic debris; 10YR2/2; a trace of fine grained sand and roots
24-45		sandy to clayey silt to peat with abundant wood and leaf debris; 5YR2/1
45-64	40-50 cm: 1410±70	silty sand, fine to medium grained, with abundant fine organic debris; 10YR4/2; abundant leafy debris and large wood fragments
64-88		slightly sandy peat, mostly leafy debris; abundant wood fragments; 10YR2/2
88-92	81-91 cm: 2070±60	Sand, fine to medium grained, with a trace of organic debris; 5Y7/2
92-174	120-130 cm: 10450±100 169-177 cm: 10470±90	clayey tisolty sand, fine grained with very fine organic debris; 5YR4/1
174-190		silty sand, fine to medium grained, with very fine organic debris 5YR4/1 to 10YR2/2
190-204		sand, medium to coarse grained; 5Y7/2
204-213		clayey to silty sand, fine-grained with trace of fine organic debris; 10YR4/2
213-256		sand, fine to medium grained; 5Y7/2
256-263	257-262 cm 11420±350	clayey to silty sand, fine grained with trace of fine organic debris; 5Y5/2; traces of leaf and wood debris
263-278		sand, medium to coarse grained with coarse sand and granules; 5Y7/2
278-304		sand, coarse to very coarse grained, with abundant granules and pebbles; 5Y7/2
304-316		silty sand, fine to medium grained, with occasional coarse sand; 10YR5/4
316-352		clayey silt with very fine organic debris; 10YR2/2

Core Pc-17

0-10		clayey silt with fine organic debris; occasional roots; 10YR2/2
10-66		silty clay with abundant fine organic debris with some roots and leaf debris; 10YR2/2 &5YR2/1
66-103	70-75cm: 5680±80	silty clay to peat with abundant fine organic debris with trace fine grained sand 5YR2/1
103-124		clayey silt with trace fine organic debris; fine grained sand and leafy organic debris; 5Y5/2
124-140		sand, fine-grained with trace roots and some organic debris; 10YR2/2
140-208		sand, fine to medium grained, with occasional thin layers of clayey silt to sand; 10YR2/2
208-240		sand, medium to very coarse grained; 5Y7/2
240-267		sand, medium to coarse grained with occasional coarse sand & granules; 5Y3/2
267-292		clayey silt with trace fine organic debris; 10YR2/2

Each sediment core was subsampled into 1 cm intervals and stored in labelled ziploc bags at 4°C. 1.5 ml of sediment was removed from selected subsamples, weighed and treated with hydrochloric and hydrofluoric acid. The sample was then acetylyzed by boiling for 2 minutes in a mixture of sulfuric acid and acetic anhydride. The residue was washed in glacial acetic acid, water, and ethanol. The entire residue of each sample is stored in 25 ml tertiary butyl alcohol. An aliquot of 0.1 ml of the treated sample was mounted in silicone oil on a microscope slide, and all of the pollen identified and counted on a slide.

The pollen identified in the cores is listed in Table 2.

Table 2. Pollen taxa identified in Cores PC14 and PC17;

Conifers:

<i>Juniperus</i>	red cedar		
<i>Pinus</i>	pine		
<i>Tsuga</i>	hemlock		
Angiosperms (arboreal):		(non-arboreal)	
<i>Alnus</i>	alder	<i>Ambrosia</i>	ragweed
<i>Betula</i>	birch	<i>Cephalanthos</i>	buttonbush
<i>Carya</i>	hickory	Cyperaceae	sedge family
<i>Castanea</i>	chestnut	Ericaceae	blueberry family
<i>Celtis</i>	hackberry	Gramineae	grass family
<i>Corylus</i>	hazelnut	Leguminosae	legume family
<i>Fagus</i>	beech	Myricaceae	myrtle family
<i>Fraxinus</i>	ash	Nymphaeaceae	water lily family
<i>Ilex</i>	holly	<i>Plantago</i>	plantain
<i>Juglans</i>	walnut	Polygonaceae	buckwheat family
<i>Liquidambar</i>	sweet gum	<i>Sagittaria</i>	arrowhead
<i>Magnolia</i>	magnolia	Saxifragaceae	saxifrage family
<i>Morus</i>	mulberry	<i>Sparganium</i>	bur-reed
<i>Nyssa</i>	black gum	<i>Solidago</i>	goldenrod
<i>Platanus</i>	sycamore	<i>Stellaria</i>	chickweed
<i>Prunus</i>	cherry	<i>Typha</i>	cattail
<i>Quercus</i>	oak	Umbelliferae	parsley family
<i>Robinia</i>	black locust	<i>Viburnum</i>	arrowwood
<i>Salix</i>	willow	<i>Vitis</i>	grape
<i>Tilia</i>	basswood		
<i>Ulmus</i>	elm		
Pteropsida			
<i>Dryopteris</i>	wood fern		
Filicineae	undifferentiated ferns		
<i>Osmunda</i>	cinnamon fern		
<i>Sphagnum</i>	sphagnum moss		

Concentrations (numbers of pollen grains  $\text{cm}^{-3}$ ) and relative percentages of pollen taxa are plotted against depth (Figs. 2 - 5). Coniferous grains are indicated by horizontal lines in the silhouettes. Stippled silhouettes indicate 5x exaggeration.

#### CORE PC-14 (Figs. 2, 3)

The bottom part of this core is believed to be pre-Holocene (J. Pizzuto, personal communication). The pollen profile lends support to this interpretation. Sediments deposited prior to 11,000 years ago at the bottom of the core contain abundant pine, hickory and oak, which is not characteristic of early Holocene, but does resemble older interglacial profiles collected from the upper Chesapeake Bay area (Brush and Hughes, 1992).

Sediments deposited between 11,000 and 10,400 years contain very little pollen. Most layers have no pollen. Around 10,000 years ago, the pollen profile is dominated by pine, wood fern and some club moss. Sphagnum moss is also abundant. Hemlock and red cedar are present, along with birch, alder and maple. Included in the pine category are a few spruce and fir pollen (see Appendix). The pollen assemblage indicates that this portion of the core is early Holocene. This period is followed by hickory and walnut. Oak which occurs along with conifers continues from 10,000 years to the present. The hickory-walnut zone is accompanied by chestnut, holly, sycamore, black locust and elm. Several herbaceous forms, including members of the blueberry family, arrowhead, members of the parsley family, grasses, and arrowwood accompany hickory and walnut. This assemblage is representative of middle to more recent Holocene. Sedimentation rates appear to be very low during this time, so the resolution is low. and dry periods possibly indicated by hickory and wet periods by walnut. However the pollen indicates a drier period following early Holocene, characterized by increases in hickory, blueberry and goldenrod. Walnut which suggests wetter conditions as well as cattail appear to occur synchronously, but this may be due to the integration of wet and dry periods due to extremely low sedimentation. Very little pollen is contained in the core from 100 cm to the top 25 cm. The top part of the core above 25 cm from the surface contains abundant ragweed, indicating that this sediment has been deposited since European settlement. Oak, hickory, walnut, holly and elm are the most important tree taxa during recent time, and represent a Coastal Plain vegetation. Herbaceous pollen constitute an important part of the recent assemblage.

#### CORE PC-17 (Figs. 4, 5):

The pollen profile for Core PC-17 indicates that it contains some of early Holocene, as well as middle and recent Holocene sediments. Pollen concentrations are highly variable throughout the core, with the highest numbers between 100 and 125 cm. Included in the pine category are some fir and spruce grains at the bottom of the core (see Appendix). Moreover, pine pollen contains a wide range of sizes from very small ( $<40\mu$  to  $90\mu$ ), suggesting that there were several species of pine. The pine peak, which is accompanied by a peak in hemlock, correlates with a peak in wood fern and cinnamon fern and abundant sedges. This is followed by increases in hickory and holly, and among the herbaceous flora by members of the blueberry family and also by goldenrod, indicating drier conditions. Ragweed characterizes the sediments above 25 cm, indicating that this is post-European time. Some Coastal Plain deciduous tree pollen are present and a number of herbaceous types.
